

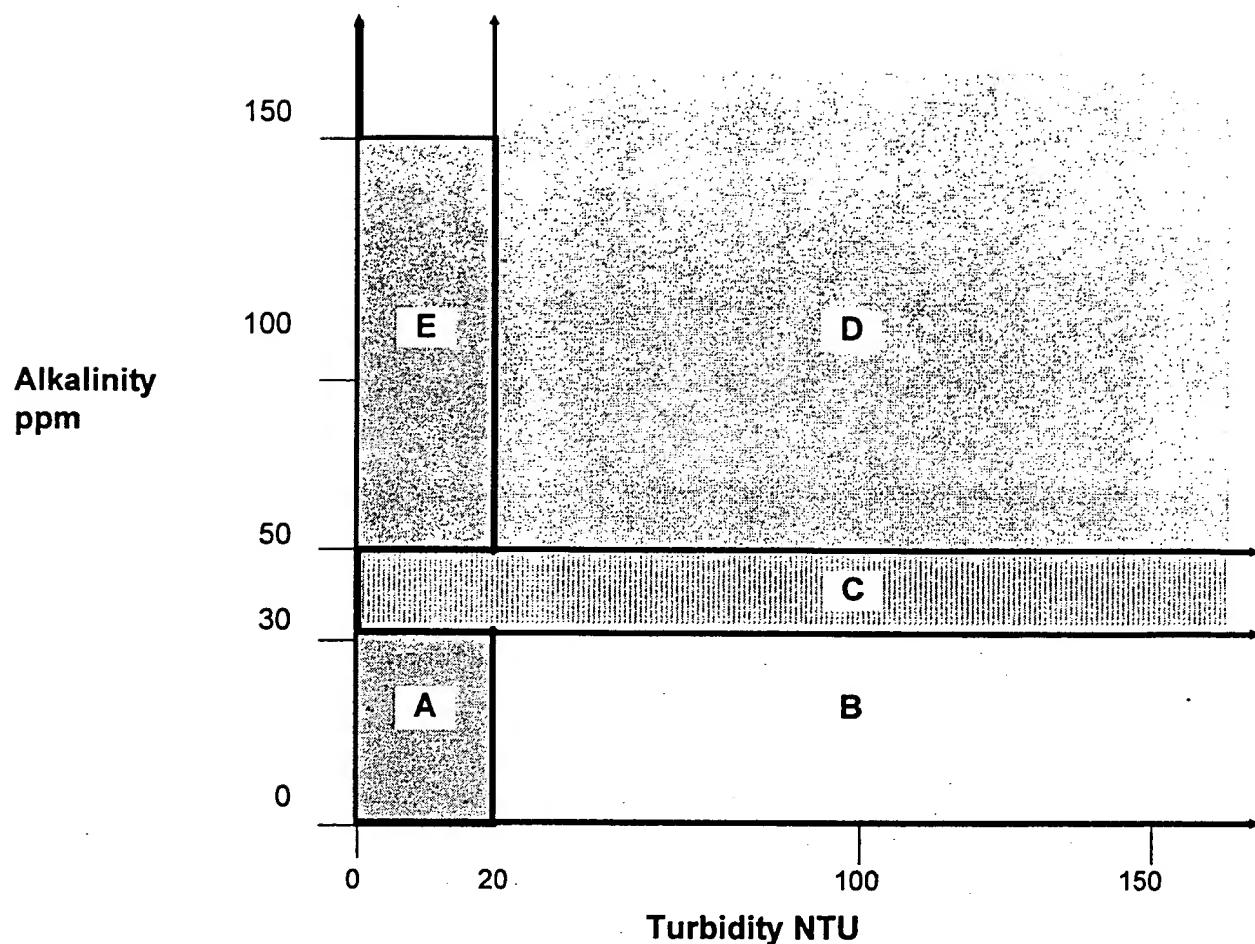

Figure 1

- A** - Low alkalinity with low turbidity.
- B** - Low alkalinity with moderate and high turbidity.
- C** - Low alkalinity with low, moderate and high turbidity.
- D** - Moderate and high alkalinity with moderate and high turbidity
- E** - Moderate and high alkalinity with low turbidity.

Figure 2

Required Removal of TOC by Enhanced Coagulation and Softening			
Raw Water TOC (ppm)	Raw Water Alkalinity (ppm as CaCO ₃)		
	0-60	61-120	>120
>2.0-4.0	35.0%	25.0%	15.0%
>4.0-8.0	45.0%	35.0%	25.0%
>8.0	50.0%	40.0%	30.0%

1. Best Results of dosage curve.

2. Anthracite filters can easily remove 5 Standard Color Units.

3. Dosages are on a mass basis. Products are 40 to 50 percent active. For dosages on an active basis, conversions must be made.

4. Jar test designed to match the plant, which had VERY poor mixing. With plant modifications, operation is less than 1.0 NTU. Please refer to write up in the specification.

*** CV1710 obtained 47% TOC removal. Alum only obtained 19%.

1. Best Results of dosage curve.
2. Dosages are on a mass basis. Products are 40 to 50 percent active. For dosages on an active basis, conversions must be made.
3. DADMAC is 20% active with a viscosity of 20 cps which correlates to a molecular weight of 250,000.
4. Epi-DMA is 50% active with a viscosity of 150 cps which correlates to a molecular weight of 300,000.
5. ACH is 50 percent active. AlCl₃ is 50% active.
